

# Secure ID System

WEI's **Secure ID** System was developed to provide an easy way for parents to ensure that accurate information is readily available to law enforcement agencies in the event that a child is lost or abducted. The system can also be used to issue other secure ID cards within municipalities, such as Police Officer ID cards.

Sample Card Front

Sample Card Back

**How It Works** - The child is photographed with a digital camera, their fingerprint is captured and personal data is entered into the system. The plastic driver's license style **Secure ID** card is produced and given to the parents. The pictures and data can be saved to a secure database controlled by the local police department. If a child is lost or abducted, the pictures and data can be quickly broadcast to aid law enforcement in finding the child. If specified, the system can be configured to provide **AMBER Alert** System compatibility.

**Privacy and Safety** - Without exception, no images and/or data are available to anyone outside appropriate law enforcement agencies and only for emergency purposes! If parents wish, the data can be deleted after the **Secure ID** card is printed.

**The System** - WEI's **Secure ID** system consists of 1 or 2 laptop computers running WEI's **Secure ID** software, a digital camera, a fingerprint capture device and a card printer. WEI produces secure ID solutions for business, municipalities and Digital Driver's License systems for various Departments of Motor Vehicles throughout the US.
